**Annotatsiya:** maqolada dual ta'lim bilim va kasb bir vaqtning o'zida o'rganiladigan ta'lim ekanligi isbotlangan. Bu ta'lim nafaqat o'rta maxsus yoki kasb-hunar ta'limida, balki oliy ta'limda ham qo'llanilishi mumkinligi ta'kidlangan.

**Tayanch so'zlar:** ta'lim, dual ta'lim, kasbiy ta'lim, kasb-hunar ta'limi, oliy ta'lim, nazariya, amaliyot, etuk mutaxassis.

In the conditions of current scientific and technical globalization, the world is developing so fast that the innovations created today lose their essence in a short time, because this innovation is being improved and created in other countries, by other people. In such conditions, there is no time to wait, there is

no opportunity to act in a hurry. We just need to look for ways not to be left behind. Because of this, it is necessary to organize an educational system that ensures the harmony of theory and practice. Such education is usually called dual education.

Instructions for the introduction of dual education in our country began a few years ago. In particular, on February 1, 2019, the President of our country signed the decision "On measures to further expand multilateral cooperation between the Republic of Uzbekistan and the Federal Republic of Germany". Later, this document is widely used in countries such as Japan and Germany for the training of dual education professionals. This educational system is also being implemented in our country. In this regard, on June 15, 2022, the head of our country held a video selector meeting on measures to prepare the population for careers and improve the activities of monocenters, one of which focused on the development of dual education. As the President noted, noting that there are also positive experiences in this field, "based on the experience of Germany, a dual educational form of on-the-job training has been established in 57 professional educational institutions."

"Dual education is a form of education in which the practical part of training is carried out at the workplace, and the theoretical part is carried out in an educational institution." This is a unique mechanism in filling the production sectors with high skills through the education system. In fact, dual education makes it possible to study not only the production branches, but also the entire economic sphere simultaneously, both theoretically and practically, and prepare professional, mature personnel. The interrelationship of these is reflected in the figure below (Figure 1).

Amaliyot

Tarbiya

Salohiyat

As can be seen from picture 1, in order to be perfect, a person should have theoretical knowledge and practical skills as well as being spiritually mature, having faith, fearing others, and being wary of various forms of betrayal and injustice. Only then will a person be worthy of trust, first of all, and then of others. Only such people play an important role in ensuring the development of society and deciding its fate

It can be concluded that the society needs to train the personnel it needs. Because of this, the whole society will have to work to train one highly qualified staff. Because the future specialist must grow up in the family, he must receive the appropriate knowledge and manners at school. In the later stages of life, one or another person of our society participates in its formation.

In reality, everything has a return. Goodness and progress return to such a society as progress with goodness. It means that specialists should constantly improve their skills. Only then experts will not lag behind the times, and such a country will not lag behind the development of the world, but will have the opportunity to advance and advance. Therefore, training of modern personnel is very important for today's New Uzbekistan. One direction of training of modern personnel is the introduction of dual education in our country.

Now, it can be said about the formation of spiritual quality in a specialist with intellectual potential, which ensures spiritual maturity, that several factors are involved in this. Education also begins with the family. The environment in which children grow up is also an important factor in the formation of their thinking and character. From this conclusion, parents should not be indifferent to who the child is with when he is young. Another important factor is pre-school education, then school education, then vocational education and finally higher education. In all of them, as we noted above, the harmony of theory and practice should be ensured. The systematic chain of this process is reflected in the figure below.

As it can be seen from the picture, the formation of an all-round mature specialist with intellectual potential is not limited to a certain stage of education. This requires that all system steps be properly designed for the purpose. It is clear from this that in order to ensure the stable development of our country and its competitiveness, we need to improve the education system in every way. It is worth noting that in our country it is still recommended to use dual education in professional education, that is, in vocational training. Nowadays, this method of education can be used more widely. We have come to the conclusion that it is appropriate to use the dual education system in higher education institutions. Because in higher education, until now, the main attention is paid to theoretical issues. This is definitely necessary for a student in higher education. However, if at the same time he develops practical skills, he will be able to work in practice at the same time with a diploma of higher education. To implement this in higher education, it would be appropriate to organize "Educational clusters". This can be done in two directions: First, it is necessary to open enterprises and organizations suitable for the specialty under higher education, and secondly, it is advisable to establish activities on the basis of contracts with relevant enterprises and organizations suitable for specialists preparing for higher education. In this case, the highly educated personnel will get a diploma after learning the practice at once.

In the higher education system, dual education can be used in mechanical engineering, engineering, architecture and construction, economic sectors, industry, agriculture, service industries, tourism, and social security. As mentioned above, each higher educational institution can establish relevant enterprises and organizations at its disposal. At the moment, there are cases where some specialists are lacking. Therefore, we believe that it is appropriate to plan specialties and their number based on the needs of the region and the country.

In conclusion, it should be said that after studying the content of dual education, ways of its organization, its positive aspects such as simultaneous knowledge and vocational training, some conclusions were reached, and scientific-theoretical and practical recommendations were also developed;

First, based on the requirements of the present time, to evaluate the dual education system as an education that meets all the requirements, to recommend the objective necessity of studying the issue of introducing it to all stages of education in our country.

Secondly, in the training of mature specialists of dual education, conducting theory and practice together, devoting part of the week to theory and another part to practice, giving great importance to education and the formation of high spirituality in all processes;

Thirdly, we believe that it is appropriate to train mature, intellectual potential specialists in our country at all stages of the education system. While ensuring harmony between practice and theory, systematic use of all factors affecting the formation of spiritually mature professionals;

Fourthly, it is necessary to implement dual education in the field of higher education and to implement it in two directions. Firstly, it is necessary to organize enterprises and organizations suitable for the specialty under higher education, and secondly, it is appropriate to organize an educational cluster in order to establish activities on the basis of a contract with relevant enterprises and organizations suitable for specialists trained by higher education.
